

Fork Positioner for Forklifts

Forklift Fork Positioner - A fork positioner is a device constructed out of high quality materials intended to be able to endure the most difficult procedures and work environments. This particular piece of equipment could enable the one driving to maneuver the blades hydraulically without leaving the seat. Side shifting models have the extra ability to laterally position the arms or the entire load so as to facilitate more precise lifting and position in a quicker and much more efficient manner.

The fork pocket is somewhat unique and could enable the person operating it to be able to securely swing the forks into position without any fear of damaging the positioning cylinders. This could allow the driver the choice to be able to perform independent or simultaneous fork movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be transformed into blade positioners on available units.
